

Everyone deserves
clear answers about
their breast health.

Breast density can have an impact on breast cancer risk and the possible need for supplemental imaging. Therefore, it's important to have a comprehensive discussion with your doctor. Here are some important questions you can use to guide the conversation.

- > Does my mammogram indicate that I have dense breasts?
- > If so, how dense are my breasts? Which breast density category am I in?
- > What does this mean for my personal breast cancer risk and what are other risk factors?
- > What if I also have other known risk factors in addition to having dense breasts?
- > I understand that depending on my breast density category, potential tumors may be missed on mammograms. What are your thoughts on this and its implications?
- > What are the most appropriate imaging procedures for my personal breast density category, personal history, and other medical considerations?

Remember to speak with your doctor about your breast density, breast screening and all other healthcare needs.
